The Disconnect: Complex Data vs. Public Understanding

Economic indicators like inflation, GDP, and unemployment rates are publicly available—but the *reasons* behind their fluctuations remain inaccessible to most people.

Data is Accessible, Context is Not

While the numbers are available, the underlying causes and relationships remain hidden in technical jargon and complex reports.

Buried Information

Critical context—geopolitical conflicts, policy changes, supply chain shifts—is scattered across dense financial reports and fragmented news cycles.

The Understanding Gap

The general public struggles to connect global events with the numerical trends that directly impact their daily lives and financial decisions.

The Economic Interpreter: Translating Data into Stories

A Generative AI-powered system designed to bridge the gap between raw economic data and human understanding.

What It Is

An AI system that transforms complex economic data into clear, accessible narratives anyone can understand.

How It Works

Correlates historical and real-time economic time-series data with relevant global news events from multiple sources.

The AI Advantage

Uses Large Language Models to synthesize complex correlations into simple, jargon-free explanations.

User Experience

Users receive clear trend visualizations paired with easily digestible bullet points explaining cause and effect.

Made with GAMMA

How Data Becomes a Story

The system transforms raw numbers into meaningful narratives through a sophisticated multi-step process.

01

User Inquiry / Event Detection

System detects an economic anomaly or responds to a natural language question from the user.

02

Data Fetching

Retrieves time-series data from World Bank and pulls temporally aligned news events from GDELT or News Archives.

03

Data Alignment

Aligns quantitative data trends with qualitative news data based on specific timeframes.

04

RAG Pipeline

Relevant news snippets and data context are passed to the Retrieval-Augmented Generation system.

05

LLM Synthesis

Large Language Model digests technical information and drafts a simplified, human-centric narrative.

06

Final Output

Interactive graph displayed alongside AI-generated, jargon-free explanation.

Technical Architecture & Stack

Data Layer

Datasets: World Development Indicators (WDI), GDELT Project, NewsAPI archives

Processing: Python (Pandas, NumPy) for cleaning, filtering, and temporal alignment

Storage: Vector database (ChromaDB) for RAG retrieval

Backend & AI Layer

Orchestration: LangChain or LlamaIndex for RAG pipeline

AI Models: GPT-4o, Claude 3.5 Sonnet, or Gemini 2.5 Pro

API Backend: Python (FastAPI or Flask)

Frontend & Visualization

User Interface: Streamlit or React for dashboards

Visualization: Plotly, Matplotlib, or D3.js for interactive graphs

Made with GAMMA

Empowering Through Economic Literacy

Democratizing Context

Makes deep economic context available to everyone, removing reliance on specialized financial analysts.

Proving Correlations

Seamlessly connects global human events with their numerical impact on the economy.

Future Scope

Foundational layer for informed public decision-making, better educational tools, and increased economic awareness.
